## Oil Separator Series OS

### Technical Bulletin

The OS Oil Separators are used for multiple compressor racks in supermarkets and air conditioning systems for use with HCFCs, HFCs and their lubricants.

#### Features

- Three different construction styles:
  - OSH hermetic style
  - OST with top flange
  - OSB with bottom flange and supporter
- Solid Copper ODF connections
- Stainless steel needle valve and floater
- Temperature range TS: -10°C to +150°C
- Max. allowable pressure: 31 bar
- Permanent magnet to filter metal particles out of the oil circulation
- Corrosion resistant epoxy powder painting
- CE marking according PED 97/23 EC
- Comply with UL standard

#### Introduction

Refrigeration compressors are lubricated by refrigeration oil that circulates from the compressor crankcase or housing. As refrigerant gas is discharged by the compressor, it will leave with a fine oil mist, that will be circulated throughout the entire system.

Small amounts of oil circulating through the system will not affect the system performance. Too much refrigeration oil circulating in the system will have adverse effects on the components in the system. Circulating oil reduces the ability of the system to effectively remove the heat. Condensers, evaporators and other heat exchangers loose efficiency when coated internally with an oil film.

Refrigeration oil not returning to the compressor causes improper lubrication and eventual compressor failure. At low temperature application, refrigeration oil thickness becomes difficult to move, causing oil to be trapped in the system.

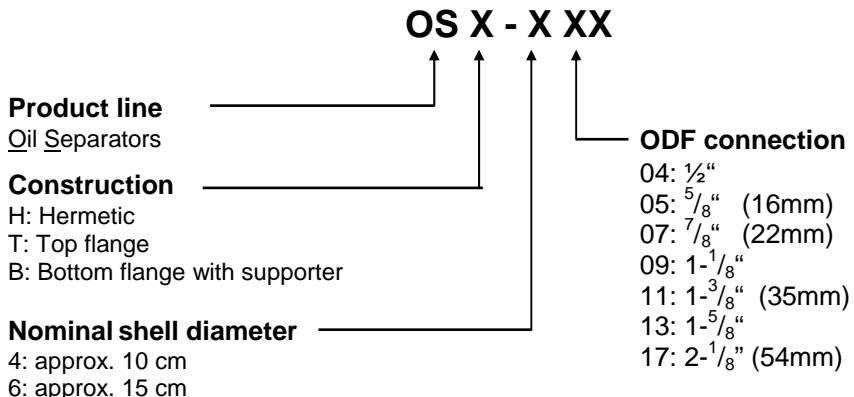

#### Function

Refrigerant gas leaving the compressor through the discharge line contains refrigeration oil in a vaporous mist. As this mixture enters the oil separator, the velocity is reduced to allow oil separation to begin. The refrigerant gas and oil mixture enters the oil separator and passes through an inlet screen, causing the fine particles to combine. Larger oil particles are formed and drop to the bottom of the oil separator.

The refrigerant gas then passes through an outlet screen to remove residual oil particles. The oil gathers in the bottom of the oil separator until a float operated needle valve opens to allow the return of oil to the compressor. Oil returns quickly to the compressor, because of the higher pressure in the oil separator than in the compressor crankcase. When the oil level has lowered, the needle valve closes to prevent refrigerant gas from returning back to the compressor. The refrigerant gas leaves through the outlet of the oil separator and goes to the condenser.

\* applied higher module as required

The nominal capacities at +38°C condensing temperature (+38°C bubble point or +43°C dew point for R407C), +4°C evaporating temperature and 1 K liquid subcooling at the inlet of the expansion valve.

## Oil Separators OS Series

### Nominal capacities for other operating conditions

For other operating conditions than nominal correction factors have to be used:

$$Q_n = Q_o \times K_t$$

$Q_n$ : Nominal oil separator capacity

$Q_o$ : System cooling capacity at specific operating conditions

$K_t$ : Correction factor

Refrigerant	Condensing Temperature °C	Correction factor $K_t$						
		Evaporating temperature °C						
		10	0	-10	-20	-30	-40	-50
R 22	25	1,29	1,31	1,33	1,36	1,40	1,44	1,49
	30	1,16	1,17	1,20	1,23	1,27	1,31	1,36

### Technical data

Maximum working pressure	PS: 31 bar	Approvals	UL
Factory test pressure PT		Paint	Epoxy powder paint
Hazard category I	34.1 bar	Protection	minimum 500 hours salt spray test
Hazard category II	44.3 bar	Solder connections	copper, ODF
Temperature Range TS	-10°C to +150°C	Shell material	steel
Fluid group	II	Package	Individual packaged Master box quantity: 6 pcs
Marking	CE		
Compatibility	CFC, HCFC, HFC, mineral and ester lubricants *		

\*) The oil separators are not released for use with caustic, poisonous or flammable substances.

Note: All pressure are given in gauge pressure.
