MOP = Max. Operating Pressure

Superheat

SS = static superheat

OS = opening superheat

SH = SS + OS = total superheat

 Q_{nom} = rated capacity

 Q_{max} = maximum capacity

opening begins to where the valve gives its rated capacity Q_{nom} .

Example

Static superheat SS = 5 K

Opening superheat OS = 6 K

Total superheat SH = 5 + 6 = 11 K

Static superheat SS can be adjusted with setting spindle.

The standard superheat setting SS is 5 K for valves without MOP and 4 K for valves with MOP.

The opening superheat OS is 6 K from when

 Correction for subcooling Δt_{sub}

The evaporator capacities used must be corrected if subcooling deviates from 4 K.
The corrected capacity can be obtained by

dividing the required evaporator capacity by the correction factor below. Selections can then be made from the tables above.

Note:
Insufficient subcooling can produce flash gas.

Design/Function

General

TE 5 and TE 55 valves have an interchangeable orifice assembly.

TE 5 and TE 55 valves are built up of three interchangeable main components:

- I. Thermostatic element, 1
- II. Orifice assembly, 2
- III. Valve body with connections, 3

For the same valve type and refrigerant, the associated orifice assembly is suitable for all versions of valve body and in all evaporating temperature ranges.

The charge in the thermostatic element depends

on the evaporating temperature range. The valves are equipped with external pressure equalization.

External pressure equalization should always be used on systems with liquid distributors.

The double contact bulb gives fast and precise reaction to temperature changes in the evaporator. It also makes fitting the bulb quick and easy.

The valves are able to withstand the effects that normally occur with hot gas defrosting.

To ensure long operating life, the valve cone and seat are made of a special alloy with particularly good wear qualities.

TE 5

TE 12 / TE 20

TE 55

1. Thermostatic element (diaphragm)
2. Interchangeable orifice assembly
3. Valve body
4. Superheat setting spindle (see instructions)
5. Ext. pressure equalizing connection with 1/4 in./6 mm flare nut

Identification

The thermostatic element is fitted with a label (on top of the diaphragm). The code refers to the refrigerant for which the valve is designed:

X = R22
N = R134a
S = R404A/R507
Z = R407C

The label gives valve type, evaporating temperature range, MOP point, refrigerant, and max. test pressure, PS.

With TE 20 and TE 55 the rated capacity is stamped on a band label fastened to the valve.

Orifice assembly for TE 5, TE 12, 20 and 55

The orifice assembly is marked on top of the spring cup, e.g. as shown in the figure. For a given size of valve, the same orifice assembly can be used for valves with ranges N and B.

The thermostatic elements are different however:

- *On TE 5 and TE 12*
the upper stamp (TE 12) indicates for which valve type the orifice can be used. The lower stamp (01) is the orifice size.
- *On TE 20 and TE 55*
the upper stamp (N/B 50/35 TR) indicates the rated capacity in the two evaporating temperature ranges N and B, and the refrigerant. (50/35 TR = 175 kW in range N and 123 kW in range B).
The lower stamp (TEX 55) refers to the valve type for which the assembly can be used.

Capillary tube label for TE 5 to TE 55

The label gives the orifice size (04). A new label always accompanies a new orifice assembly.
